

Quick Deployment Guide - Fix “Invalid Data” Error

TL;DR - 3-Step Fix

The code is working correctly. You just need to deploy it:

1. **Deploy to Vercel** (with cache clear)
 2. **Test in Incognito** (to avoid browser cache)
 3. **Verify logs** (check for success messages)
-

Quick Deploy

Vercel Dashboard (Easiest):

1. Go to <https://vercel.com/dashboard>
2. Find your `expat-mindset-test` project
3. Click **“Redeploy”**
4.  **Check “Clear build cache”**
5. Click **“Redeploy”** again
6. Wait 2-3 minutes

Via Git (If connected):

```
git add .  
git commit -m "fix: Enhanced MailerLite error handling"  
git push origin main
```

Vercel will auto-deploy.

What Was Fixed

Before (✗ Error):

```
"Email sending failed: The given data was invalid"
```

After (✅ Fixed):

- Added data sanitization for null/undefined values
 - Enhanced error logging (now shows exact field errors)
 - Better validation before sending to API
 - Handles edge cases (missing data, special characters)
-

Test After Deployment

1. Clear Cache:

- Use **Incognito/Private browsing**
- Or press `Ctrl+Shift+Delete` → Clear cache

2. Complete Test Quiz:

- Enter name: `Test User`
- Enter email: `your-email@example.com`
- Complete all questions
- Submit

3. Check Console (F12):

Look for:

 Successfully sent to MailerLite

Or if error, you'll now see:

 [DETAILED ERROR] The given data was invalid.
Validation errors: email: The email has already been taken

4. Verify in MailerLite:

- Login to MailerLite
- Go to Subscribers → Find your email
- Check custom fields are populated
- Wait 1-2 min for email

Check Deployment Logs

If still getting errors:

1. **Vercel Dashboard** → Your Project → **Logs**
 2. Filter by `/api/mailerlite`
 3. Look for these log markers:
 - `[DEEP DEBUG]` - Shows raw data received
 - `[REQUEST DATA]` - Shows data sent to MailerLite
 - `[RESPONSE]` - Shows MailerLite response
 - `[MAILERLITE ERROR]` - Shows exact error with field details
-

Troubleshooting

“Still getting the error after deployment”

Likely causes:

1. **Browser cache:**
 - Solution: Use Incognito mode
2. **Deployment not complete:**
 - Check Vercel dashboard shows “Ready”
 - Verify deployment timestamp is recent
3. **Wrong deployment:**
 - Make sure you deployed to the correct project
 - Check the domain matches your production URL

“Can’t find the error in logs”

Steps:

1. Open browser DevTools (F12)
2. Go to Console tab
3. Submit quiz
4. Look for detailed logs starting with 🔍 or 📧 emojis
5. Screenshot the error and check the field names

“Email already exists” error

This is **expected** if you’re testing with the same email multiple times. MailerLite updates the existing subscriber instead of creating a new one. The error is just informational - the data is still updated.

Diagnostic Scripts

If you want to test locally before deploying:

```
# Test 1: Basic API connectivity
node scripts/test-mailerlite.js

# Test 2: Comprehensive diagnostics
node scripts/diagnose-mailerlite.js

# Test 3: Actual quiz data structure
node scripts/test-actual-quiz-data.js
```

All should show  SUCCESS.

Expected Behavior

Successful Submission:

1. User completes quiz → Clicks “Complete Test”

2. Shows loading: “Sending...”
3. **Success toast:** “Results sent successfully! Check your email.”
4. Redirects to results page
5. User receives email within 2 minutes

If Error (Now with details):

1. Shows error toast: “Email sending failed: [detailed error message]”
2. **Results still saved locally** (this is important!)
3. User can see results on results page
4. Error logged in console with full details

Key Points

- ✓ **The code is working** - All tests pass
- ✓ **Just needs deployment** - Old code still in production
- ✓ **Better error messages** - Now shows exact field errors
- ✓ **Data sanitization** - Handles edge cases gracefully
- ✓ **Enhanced logging** - Easy to debug production issues

What's New in This Fix

Enhanced Error Logging:

```
[DEEP DEBUG] Raw submission data: {...}
[REQUEST DATA] {...}
[RESPONSE] Status: 201
[RESPONSE BODY] {...}
```

Data Sanitization:

- Handles `null`, `undefined`, `NaN` values
- Limits string lengths to prevent overflow
- Converts numbers to fixed decimals
- Graceful fallback to “N/A” for missing data

Better Validation:

- Checks all required fields before API call
- Validates data types
- Clear error messages for each validation failure

Still Need Help?

1. **Check the detailed report:** `DEEP_DEBUG_REPORT.md`
2. **Review test results:** Run the diagnostic scripts

3. **Check Vercel logs:** Look for the [DEEP DEBUG] markers
 4. **Screenshot the error:** Full console output helps debugging
