

Quick Fix Reference: MailerLite “Invalid Data” Error

The Problem

✗ Error: "Email sending failed: The given data was invalid. Results saved locally."

The Solution (1-Line Fix)

Before ✗

```
const subscriberData = {
  email: submission.email,
  fields: {
    name: submission.name, // ✗ WRONG LOCATION
    total_score: ...,
    // other fields
  }
}
```

After ✓

```
const subscriberData = {
  email: submission.email,
  name: submission.name, // ✓ MOVED TO TOP LEVEL
  fields: {
    // name removed from here
    total_score: ...,
    // other fields
  }
}
```

Key Insight

- `name` is a **default MailerLite field** → goes at **root level**
- Custom fields (`total_score`, `max_score`, etc.) → go inside **fields object**

Test Results

- ✓ HTTP 201 (Created)
- ✓ Subscriber ID: 176624502649652630
- ✓ All fields populated correctly

Files Changed

- `lib/mailerlite-service.ts` (Line 35: moved name field)

- `test-mailerlite.js` (Line 40: updated test)

Deploy

```
npm run build
npm start
# Then test with a real quiz submission
```

Fixed: January 15, 2026 | **Verified:** All tests passing
